Concept of Self-Healing Materials

Schematic illustration of the damage development in a classical material (black line), an ideal self-healing material (blue line), and a realistic self healing material (red line)

Design your Self Healing Material

Requirements

- Flow to the crack
- Crack filling
- Bonding to crack faces

- **Polymers:** Micro-capsules or chemical reactions
- **Asphalt:** Induction heating
- **Concrete:** bacteria
- **Ceramics:** ???

Self-Healing of Oxide Ceramics with (inter-)metallic Particles

$M_{n+1}AX_n$ Phase Ceramics

$M_{n+1}AX_n$ Phase Ceramics

- Thermodynamically stable nanolaminates
- Combine favourable properties of metals & ceramics
 - Good electrical & thermal conductivity*
 - Easily machinable
 - High temperature strength

* Electrical resistivity: $0.2-0.7 \mu\Omega\text{m}$ (298K)
Thermal conductivity: $12-60 \text{ W/mK}$

Crack-Healing in MAX Phases

Self-Healing in Ti_2AlC & Ti_3AlC_2

Oxidation induced crack-healing in Ti_3AlC_2

proof of principle

Selective oxidation of Al
2h @ 1100 °C in air

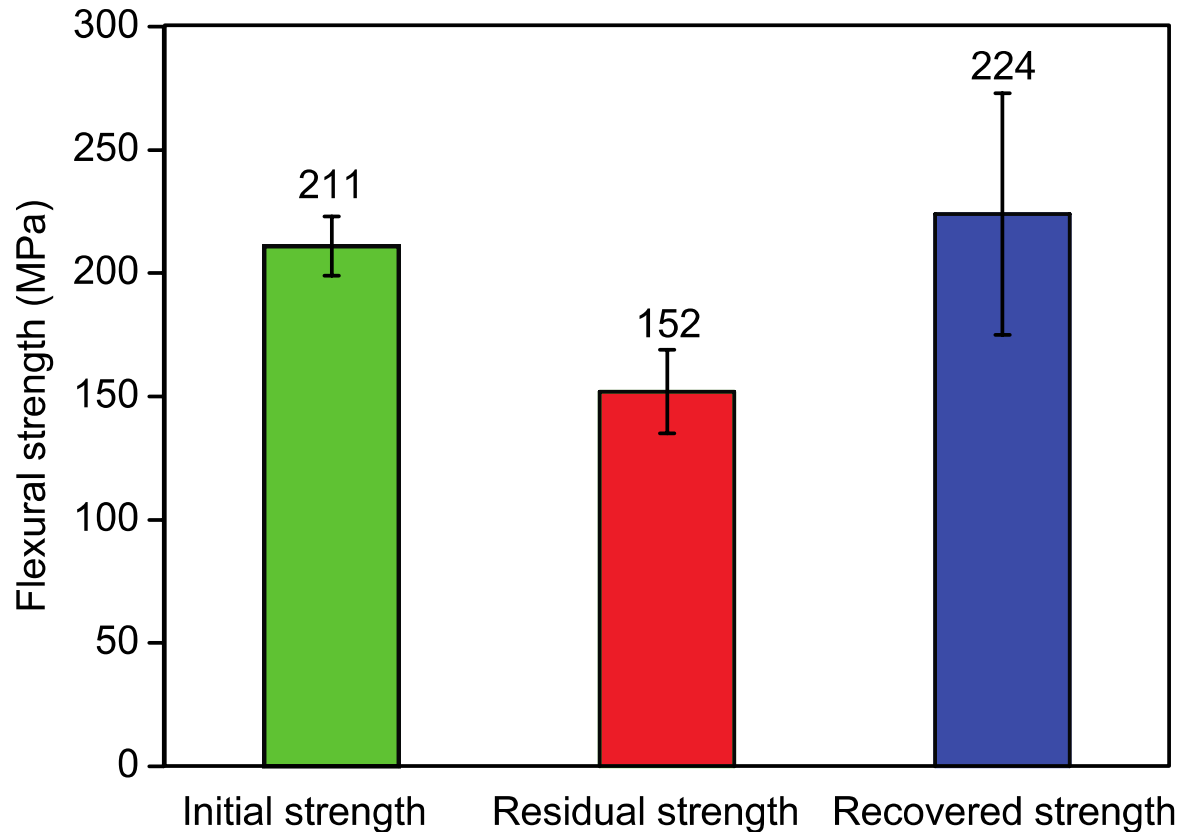

Healing product has similar
properties as matrix

Autonomous crack healing in MAX phase ceramics

- a. Crack with length of ~ 7 mm and average width of 5 microns
 - b. Crack healed after oxidation at 1100 °C in air for 2 h
 - c. Healed zone: hardness $H = 13.3 \pm 2.1$ GPa and Young's modulus $E = 305 \pm 38$ GPa
Base materials: $H = 11.7 \pm 1.6$ GPa and $E = 296 \pm 15$ GPa
- ➔ Cracks in Ti_3AlC_2 can be healed via oxidation with healing product having similar properties

Strength recovery after oxidation induced crack healing

Oxidized for 2 h in air @ 1200 °C

Element distribution in healed crack region of Ti_3AlC_2

→ Next, to reduce the amount of TiO_2 in the healing product, crack healing of Ti_2AlC is studied

Oxidation behaviour of Ti_2AlC

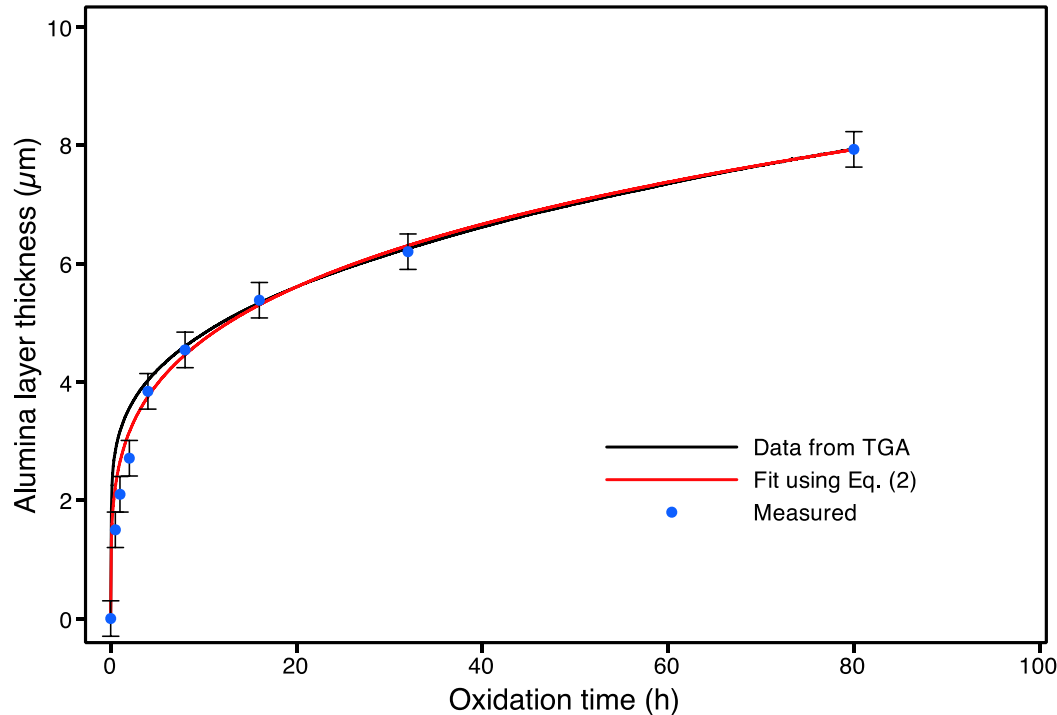

Oxidation in air:

1 h @ 1200 ° C

16 h @ 1200 ° C

- Oxidation product is mainly $\alpha-Al_2O_3$
- Only at the beginning minor amount of TiO_2 is formed
- Oxide grain size increases with oxidation time: $d_t = d_0 \sqrt{t}$

Oxidation behaviour of Ti_2AlC

Oxidation kinetics can be described with:

$$X = 2\sqrt{k_n} t^{\frac{1}{4}}$$

Where X is the alumina layer thickness, k_n is a rate constant and t is the oxidation time

Primary selective oxidation reaction:

Fast initial growth and slow subsequent growth of $\alpha-Al_2O_3$ due to reduction of fast diffusion paths, i.e. oxide grain growth

Multiple crack healing Ti_2AlC

(A) A through-thickness crack with a length of about 2.5 mm and gap of about $8\ \mu\text{m}$ introduced after loading in 3-point bending (sample width $\approx 4\ \text{mm}$)

(A) Subsequent crack healing of first fracture at $1200\ ^\circ\text{C}$ for 2 hours in air

(A) Crack path after four fracture and healing cycles, and subsequent fracture

(B) Subsequent crack healing after the fifth fracture and healing cycle

(a)

(b)

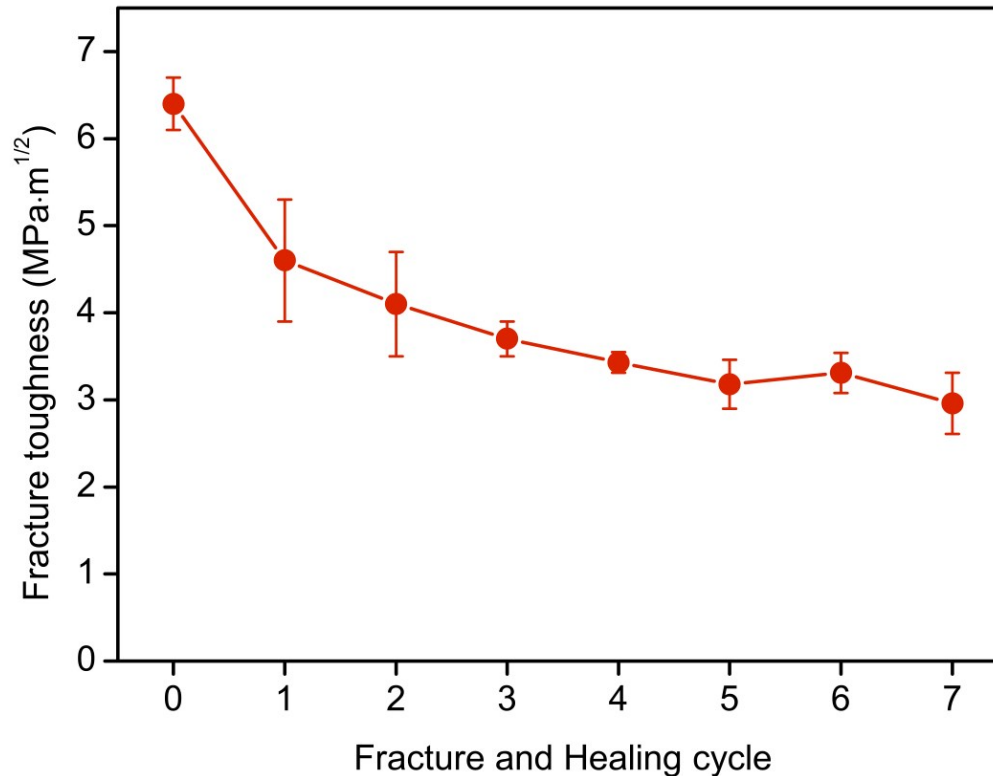

(c)

(d)

➤ Crack runs along original healed crack path

Fracture toughness evolution upon multiple crack healing

Fracture toughness at n cycles:

$$K_{Ic}(n) = \sigma Y \sqrt{\pi a_c(n)}$$

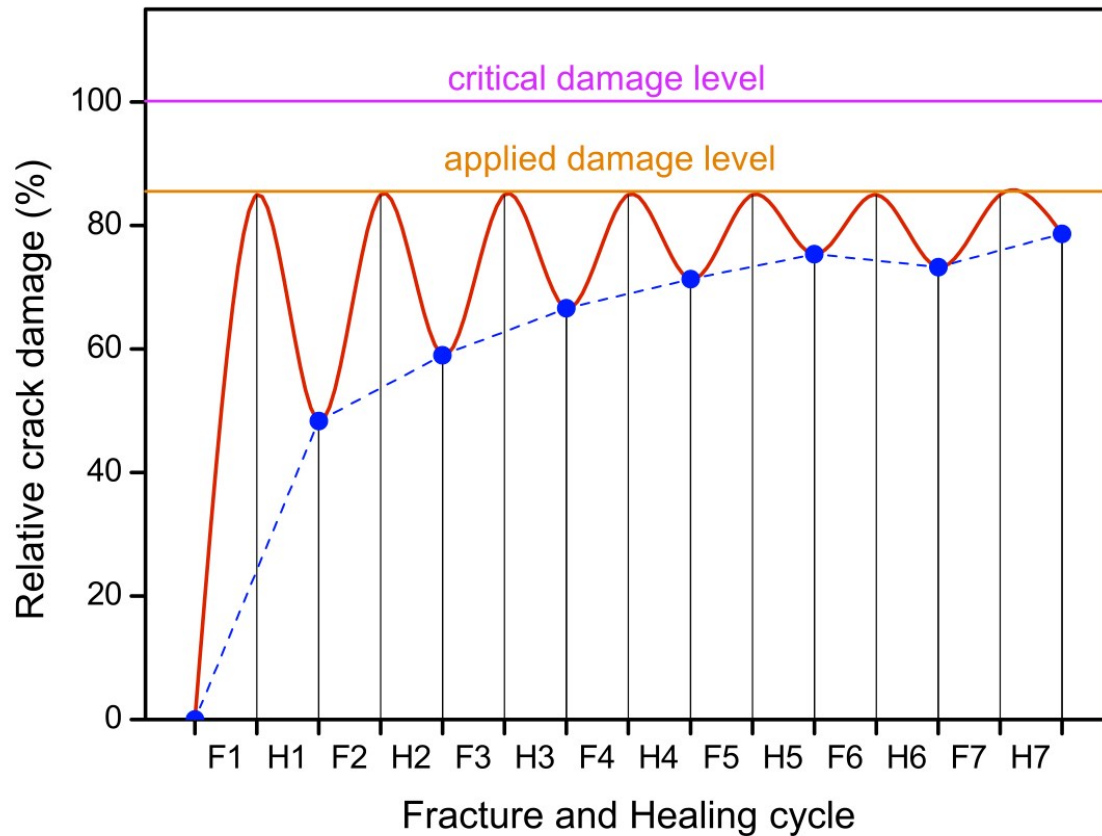

'Remnant' crack length:

$$a_r(n) = a_c(0) - a_c(n)$$

$$a_r(n) \propto K_{Ic}^2(0) - K_{Ic}^2(n)$$

➤ Fracture toughness decreases due to scars and remnant cracks

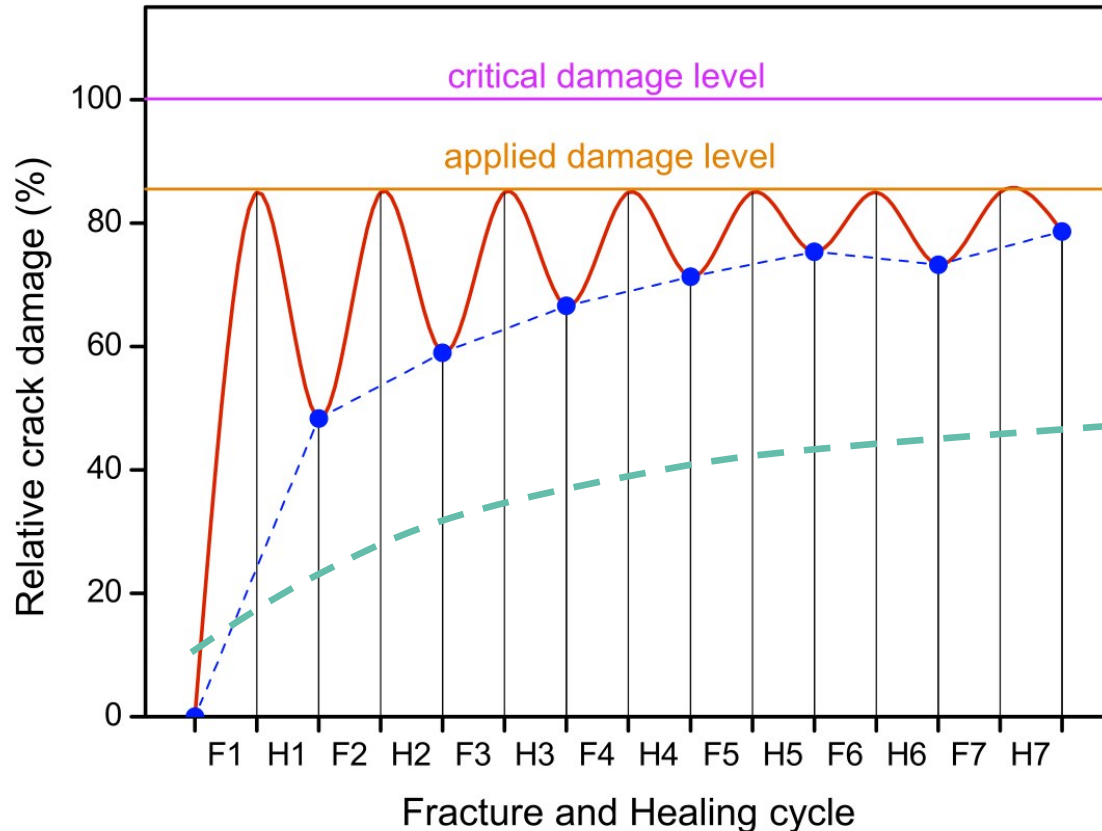

Multiple crack healing

- 'remnant' crack length

'Remnant' crack length: $a_r(n) = a_c(0) - a_c(n) \square a_r(n) \propto K_{Ic}^2(0) - K_{Ic}^2(n)$

Multiple crack healing

• 'remnant' crack length

'remnant' crack length at lower damage level

'Remnant' crack length: $a_r(n) = a_c(0) - a_c(n) \square a_r(n) \propto K_{lc}^2(0) - K_{lc}^2(n)$

➤ Depends on sample dimensions and applied damage level

Crack healing in Cr_2AlC

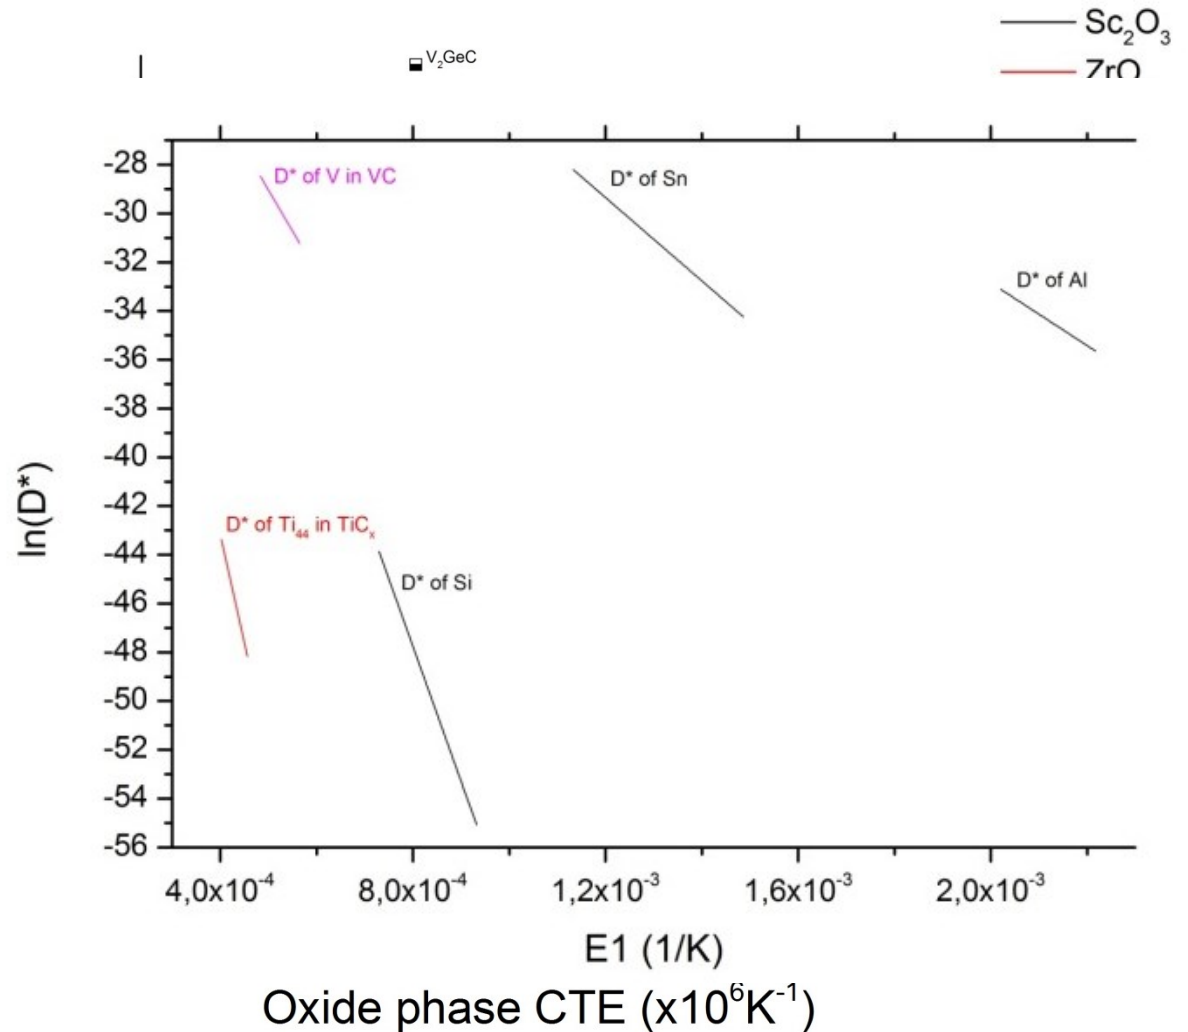

Cr_2AlC crack damage by Knoop indent exposed at @ 1100 ° C for 4 h in air

Selection of MAX Phases for Self-Healing

- ΔG of Oxide formation
- Diffusivity of oxygen
- Volume expansion
- Mechanical properties
- Adhesion of healing phase

MAX phase CTE ($\times 10^6 K^{-1}$)

Selection of MAX Phases for Self-Healing

- Al containing ceramics due to an excellent CTE match, high oxide melting temperature and strong affinity to react with oxygen.
- SiO_2 would be a viable healing agent, though to date only Ti_3SiC_2 of the Si containing MAX-phase compounds has been successfully synthesized.
- Of the M-Oxides ZrO_2 shows beneficial crack filling properties

Summary

- Crack healing by selective oxidation demonstrated for Ti_3AlC_2 ; healing products: Al_2O_3 and TiO_2
- Initial fast and subsequent slow formation of healing product; beneficial for crack healing
- Multiple crack healing demonstrated; evolution of 'remnant' crack length depends on size of damage with respect to component dimensions
- Crack healing and strength recovery of Cr_2AlC is possible; healing product: pure Al_2O_3
- Identification of potentially self-healing MAX phases underway

Crack Healing in Ti_2AlC

SHeM_{at}

Second Synchrotron experiment

@ PSI Switzerland

- SLS in situ healing
 - Laser furnace
 - Chevron notch samples
- ESRF strain analysis
 - Comparative study between different MAX phase
 - Diffraction experiments done right
- Tomography
 - 3D non destructive characterisation
 - Limits in resolution and sample size
 - Potential to help understanding self healing behaviour

Synthesis of MAX Phase Ceramics

Spark Plasma Sintering

- Pulsed DC current
- ✓ Short processing time
- ✓ Fast consolidation
- ✓ Even heat distribution
- ✓ High level of control

Learning curve for new materials
